

Dry forests support the livelihoods of many of the world's poorest people – but these valuable ecosystems are disappearing fast, and research to inform policy is, in the large part, lacking.

"

Hundreds of millions of people depend on dry forests. Destroy these forests and you destroy their well-being.

Dr. Phosiso Sola, CIFOR

Why are dry forests important?

Dry forests account for nearly half of the world's tropical and subtropical forests, ¹ spanning large areas of Africa, Latin America and the Asia Pacific. The timber and non-timber products they provide are essential to the livelihoods and well-being of millions of the world's poorest people. ² Dry forests also provide invaluable ecosystem services that support the agricultural systems upon which millions of subsistence farmers depend. ³

Yet tropical dry forests are at even greater risk of disappearing than humid forests, primarily due to higher population densities and the associated demand for energy and land.

Dry forests differ from humid forests in the goods and services they supply and their management needs,⁴ yet receive relatively little research attention – which means the data required for site-specific, evidence-based policy are often incomplete.

Dry forest quick facts

Fuelwood demand may be the second largest cause of deforestation in developing countries.¹¹ Asia is thought to account for almost half of the world's fuelwood consumption.¹²

Dry forests comprise almost half of the world's subtropical and tropical forests.¹ 2

Despite the clear and urgent need for policy to support dry forests, much of the data required is absent or incomplete.

Why tropical dry forests matter to people

Food: Tropical dry forests contribute to local diets with wild fruits, vegetables, nuts, edible insects and bushmeat. These forest products are extremely important for food security, especially in times of scarcity. In addition, wild foods provide essential nutrients to the diets of people who live in or near forested areas.¹⁴

Fuel: Wood is the main source of energy for households in dry forest areas. Some 2.4 billion people – about 40 percent of the population of less developed countries – cook with fuelwood. Of these, 764 million people may use wood to boil water for drinking.¹⁵

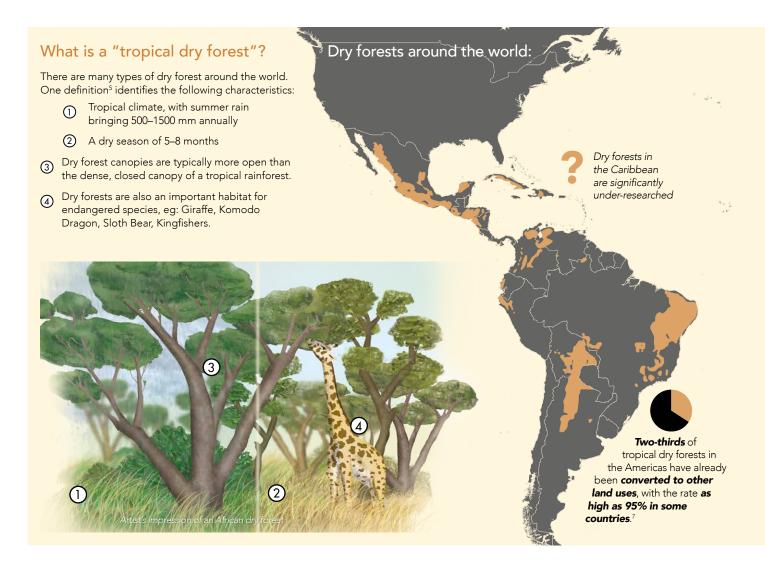

Livelihoods: Dry forests supply products that can be gathered and sold, such as beeswax, honey, plants, insects or wood for charcoal making. These freely accessible products provide even the very poor with enterprise opportunities, which, with support, can become a means of economic development and poverty alleviation.¹⁶

Carbon storage for climate change mitigation:

By storing carbon, dry forests help mitigate climate change. It is known that dry forests store less carbon than humid forests, but very little is known about the actual amounts of carbon stored, as measuring carbon stocks requires a different approach from humid forests, and dry forest inventories tend to be incomplete, missing or out of date.¹⁷

Climate change adaptation: The food and livelihoods provided by dry forests may play a critical role in building communities' resilience to climate change and variability. 18

Support of agriculture: Dry forests provide a wide range of ecosystem services, such as water management, livestock provisioning, pollination services, nutrient cycling and soil improvement. Through these services, dry forests play an important, complex – yet not fully understood – role in supporting the agricultural systems upon which millions of subsistence farmers depend.³

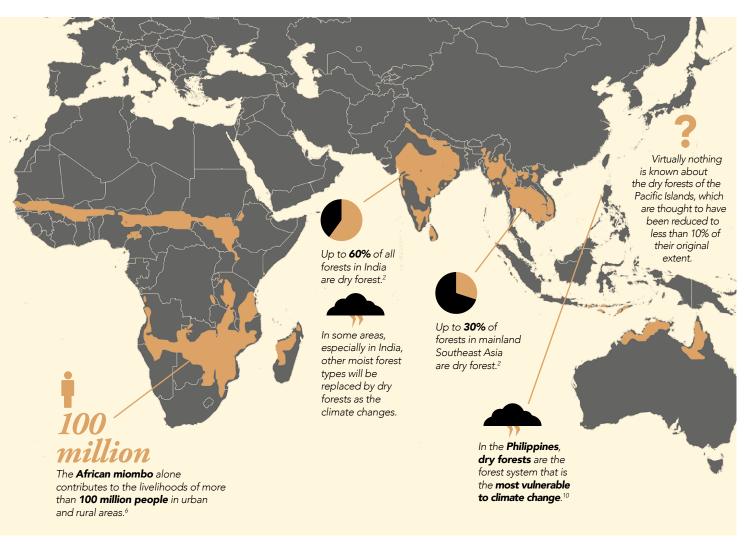

Priority areas for research on tropical dry forests

An analysis of the state of knowledge on tropical dry forests revealed the following research priorities for building knowledge to inform policy:¹⁹

- Establish a globally agreed definition of tropical dry forests. The FAO definition (see diagram)⁵ is one possible option.
- Establish national and global dry forest inventories.
- Improve knowledge of the biophysical aspects of dry forests, their ecosystem services and opportunities for sustainable intensification of agriculture in Africa, Asia, the Caribbean and the Pacific.
- Investigate human-forest interactions in Latin America, Asia, the Caribbean and the Pacific.
- Facilitate information sharing on research methodologies across regions.
- Assess the impacts of cross-border and internal trade and investment, the potential for carbon sequestration, and environment-development trade-offs in all regions.

- Examine how the needs and demands of humans and forestry management systems change as societies change.
- Update information on deforestation in African dry forests
- Research the contribution of dry forests to livelihoods across Latin America
- Research all aspects of dry forests in Asia, the Pacific and the Caribbean
- In all regions, increase research on sustainable management of dry forests, as well as analysis of forestry policy and policy in other sectors that affect dry forests.
